### REASONS FOR ALLOWANCE

1. The Reasons for Allowance below is referred to the **6-page** set of claims dated 10/06/2006 starting from page 22 to page 27.
2. Claims 1-24 are allowed.
3. The following is an examiner's statement of reasons for allowance:

Regarding claim 1, the closest prior arts of record are: Rune (US 2002/0060222), Saito et al. (US 2007/0091908), and Sorensen (US 7,016,336). Sorensen teaches an automatic network formation scheme including nodes discovering and connecting to access points providing access to non-ad-hoc networks, for example fixed wired networks, such as a LAN, where some Bluetooth nodes provide connectivity to the wired network via Bluetooth Access Points. Assuming a wired network is configured with an Ethernet technology, the access points can provide bridging between Bluetooth nodes and the nodes of the wired network. This is possible because the Ethernet packet format can be encapsulated on the Bluetooth side, and the Bluetooth BD\_ADDRs are assigned in the same address range as, for example, Ethernet/Token Ring/Token Bus network cards. Saito teaches presenting to wireless devices the same Bluetooth device address in different areas. Sorensen teaches. Rune teaches a Bluetooth network access point of comprising a first transceiver and at least one auxiliary transceiver have the same Bluetooth device address (BD\_ADDR). However, alone or in combination, Rune, Saito, and Sorensen fail to teach a method for rapidly

establishing a communication between at least one reader having a communication protocol and a plurality of communicating objects, each communicating object having a communication protocol and a communication address, the method comprising the steps of: defining a unique communication address for all of the communicating objects; determining whether at least one communicating object is present in the environment in which said reader is located by sending a request to the unique communication address of all the communicating objects by said reader; and sending a response signal that is time-shifted relative to response signals sent by other communicating objects by each communicating object that receives said request to reveal its presence to said reader, said response signal having a piece information specific to said communicating object, thereby reducing the time required to determine whether at least one communicating object is present as specified in the claim.

Claims 9 and 17 recite the same limitations as that of claim 1, and therefore claims 9 and 17 are interpreted and allowed for the same reasons set forth above.
